

Linking Rainwater Tanks Together

Drill a hole using a 127mm holesaw into a flat part of the tank at low level.

Tank can be linked side by side or end to end

Insert the supplied grommets (seals) into the hole.

Feed a 4 inch pipe into the hole allowing at least 500mm to be inside the tank.

Use washing up liquid if necessary to assist with pushing the pipe through the grommet.

Make sure there is at least 500mm distance between tanks
